.This histogram shows the distribution of exam scores in the dataset. The majority of scores fall between 65 and 70, with fewer students scoring below 60 or above 75. This indicates that most students' performance is clustered around the average, with fewer outliers. .The picture shows a correlation matrix, which tells us how different factors relate to exam scores. "Attendance" and "Hours Studied" have a strong positive relationship with "Exam Score" (0.68 and 0.50, respectively), meaning students who attend more and study more tend to score higher. "Previous Scores" has a weaker relationship with "Exam Score" (0.20). .The boxplot shows exam scores by gender. Both female and male students have similar exam score ranges, with medians around 68-70. There doesn't appear to be a big difference in exam scores between genders. .This scatter plot shows the relationship between hours studied and exam scores. Generally, as students study more hours, their exam scores tend to increase. The dots form an upward pattern, showing a positive link between studying time and exam performance.

Coefficients: The estimate values show how each variable impacts exam\_score. For example: Hours\_studied has a positive coefficient (0.298) indicating that more study hours are associated with a higher score. Significance Levels: Most predictors are highly significant (indicated by \*\*\* in the  $\Pr(>|t|)$  column), suggesting they meaningfully impact Exam\_Score. Model Fit: The high R-squared (0.99) indicates that this model explains about 99% of the variance in Exam\_Score, suggesting a strong fit.
